

## Education Inequality Profile: Ethiopia

Education Inequality Profiles portray data for 15-24 year olds by ethnic, religious, and subnational composition for the following indicators: Group Gini (GGini) Index, educational attainment, and mean years of schooling.

The GGini, based on mean years of schooling, can be interpreted as a measure of how concentrated the total stock of education is in any group or region. A GGini of 0 would mean that all groups or regions have the same mean years of schooling, while a GGini of 1 can be understood loosely to correspond to a situation where one group or region has essentially exclusive access to all the education in the country.

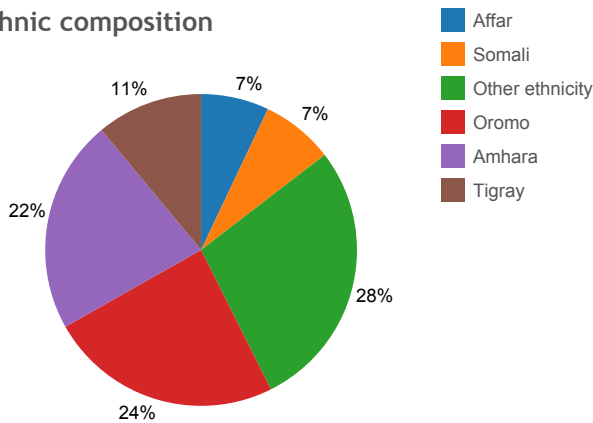

Data for the Ethiopia profile was extracted from DHS 2011. Ethiopia's highest GGini is the subnational GGini at 0.084. Educational attainment is the highest in Addis Ababa, Dire Dawa, and Harari, where 20%-22% of 15-24 year olds completed secondary schooling, as compared with 4%-9% elsewhere.

Group Gini

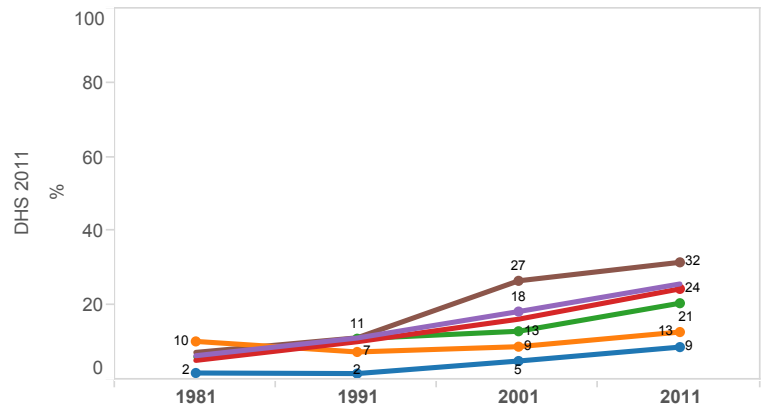

### Ethnicity

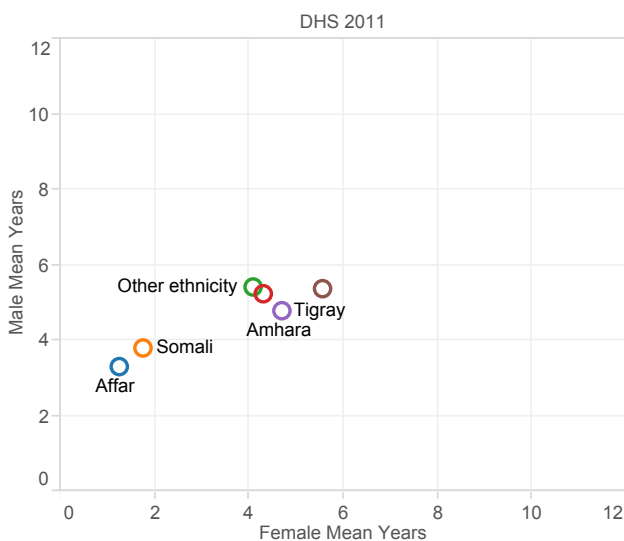

Ethnic composition

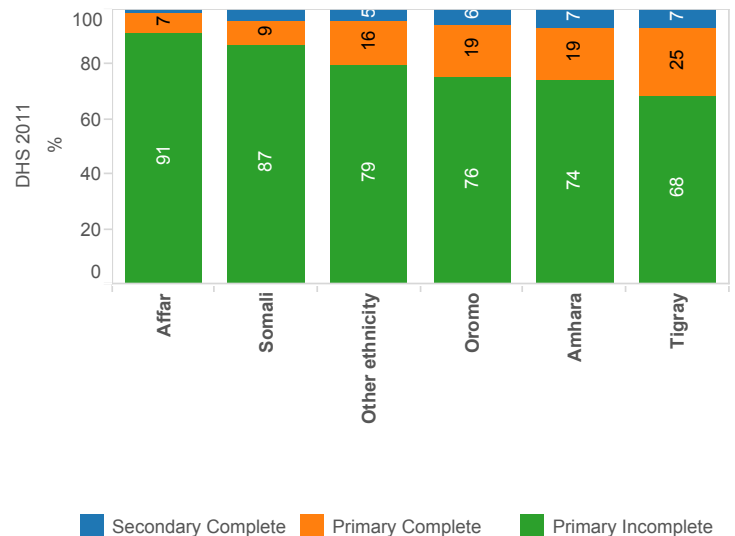

% of population with at least primary education completed

Mean years of schooling by gender and ethnicity

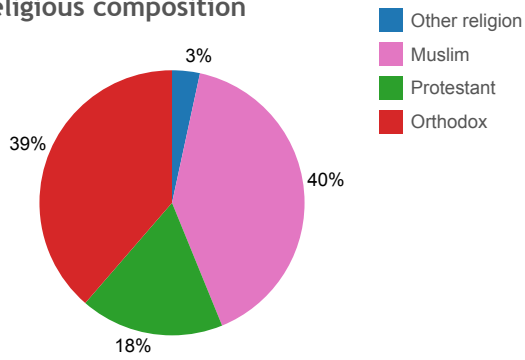

Educational attainment by ethnicity

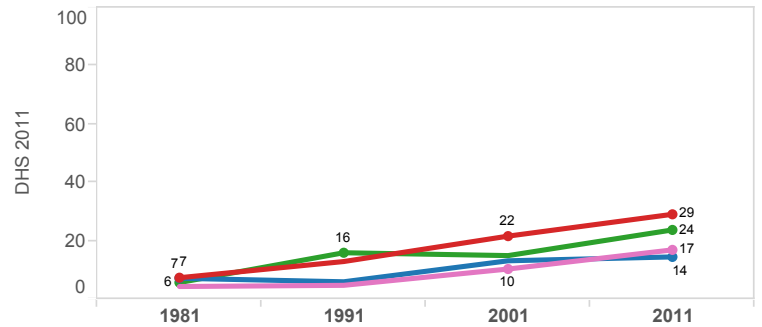

# Education Inequality Profile: Ethiopia

## Religion

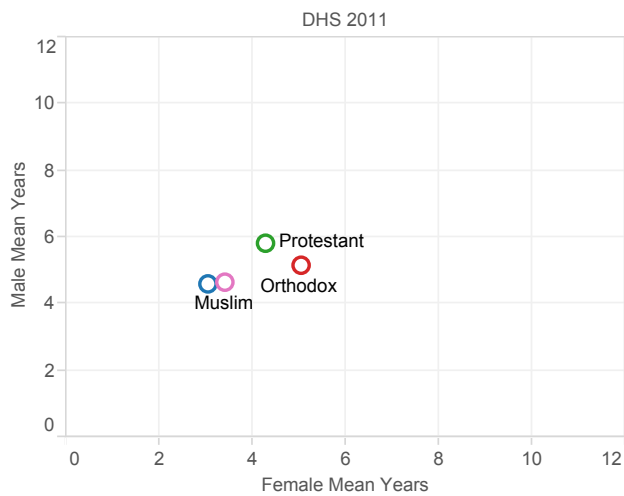

Religious composition

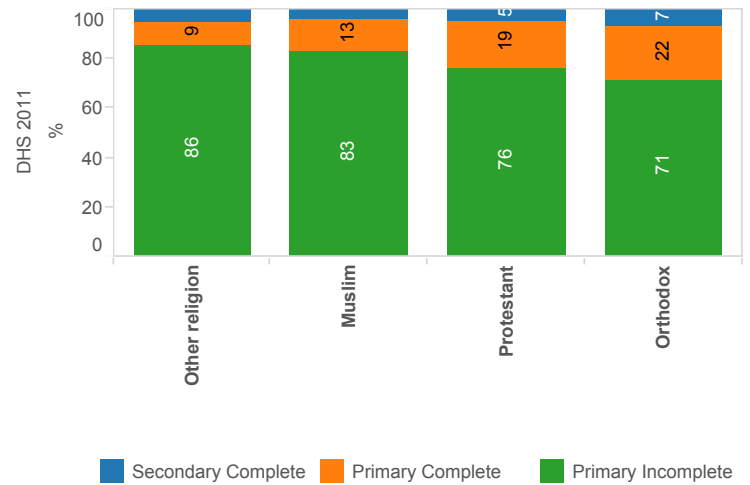

% of population with at least primary education completed

Mean years of schooling by gender and religion

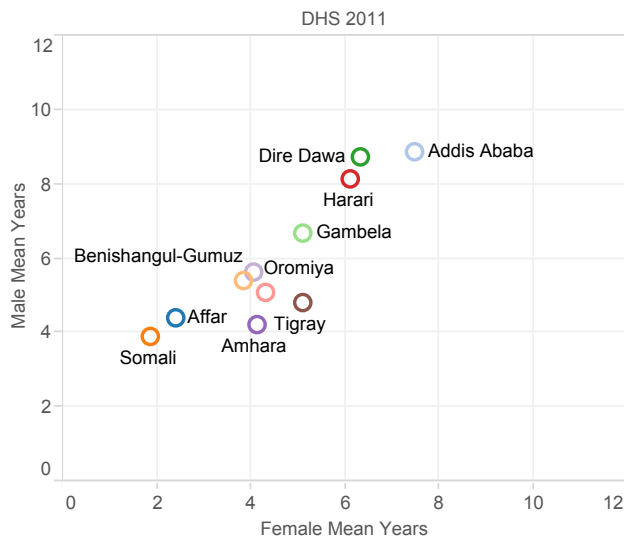

Educational attainment by religion

## Region

Mean years of schooling by gender and region

Educational attainment by region
